

Answer

Partial Differential equation, show the relationship between the AI model's predictions by averaging the impact of all other features.

Core concepts of P.D.P.

- i) Averaging - Work by isolating an element's effect and compares against others
- ii) Global interpretation - It provides a wide view of the impact of the feature element.
- iii)

Assumptions

PDP assumes that the feature of interests are independent of all other features.

Merits

- i) It is Agnostic
- ii) Gives global interpretation

Demerits

- i) Does not give local interpretation of each step.
- ii) Averaging hides heterogeneity
- iii) Has high computational costs
