

Assignment 1

Explore the fundamental concepts of association mining including support, confidence and lift metrics.

- i) Support is the proportion of transaction that contain itemset
- ii) Confidence - Measure of how often items in 'B' appear in transactions that already contain A

The formulas are important because they show that the rule can be enough for consideration or not, and confidence shows how reliable the rule is.

The Apriori property states that any subset of a frequent itemset must also be frequent which helps reduce computational costs.

Lift is more informative than confidence when the items are very common. Example: milk and bread. Here lift reveals whether the rule is truly meaningful or just due to general popularity of milk.
